GROUP 2 Progress Report: FISH++

- Focus on obtaining data from existing lakes.
  - Our group will gather reliable data from existing lakes to assess their water quality and condition.
- Use collected data to determine if water is not suitable for aquatic life.
  - We will analyze the collected data to determine whether the quality is suitable for aquatic life by examining factors such as pH, dissolved oxygen, temperature, and turbidity.
- For impact visualization: use python (pandas, matplotlib, numpy).
  - We will use Python, particularly Pandas, NumPy, and Matplotlib, to organize, analyze, and visualize the data through graphs and charts so that our findings can be easily understood

- We will also focus on the lakes in one particular province (Province : TBA)
