QUESTIONS:

1. What are structures?

Structures are a type of a grouping function that allows user to put different data types into one variable such as string, int, double, etc.

2. What are the advantages in using structures in C++?

it helps with efficiency in accessing different types of data in programming which saves a lot of time and ultimately avoids the need for hard coding.

3. How do you declare a structure in C++?

You can declare it using the keyword “struct” before the int main() and put different kinds of data types in the structure with its variable name.

4. How do you access members of a structure in C++?

You can access members using a dot: Membername.datatypename, where in you can either print, or assign a value for it.

5. Give a simple program using structure with 3 different member elements.

structs1.cpp > main()

```cpp
#include <iostream>
#include <string>
using namespace std;

struct Person {
    string name;
    int age;
    double gpa;
};

int main () {

    Person person1;

    for (int g = 0; g < 2; g++){

    cout << "Put data for person " << (g+1) << " (name age gpa): ";
    cin >> person1.name >> person1.age >> person1.gpa;

    cout << endl;
    cout << "Name: " << person1.name << endl;
    cout << "Age: " << person1.age << endl;
    cout << "GPA: " << person1.gpa << endl;
    cout << endl;
    }

    return 0;
}
```

Problems Output Debug Console Terminal Ports

```
PS C:\CPE11S4-DOMINGO> & C:\CPE11S4-DOMINGO\structs1.exe
Put data for person 1 (name age gpa): Raj 18 4.5

Name: Raj
Age: 18
GPA: 4.5

Put data for person 2 (name age gpa): Nicollie 18 3.8

Name: Nicollie
Age: 18
GPA: 3.8

PS C:\CPE11S4-DOMINGO>
```
